How do I Know If I Have Bed Bugs?

How does the Clear View Trap Work?

The CVT works by attracting bed bugs to the trap and not letting them out. All 4 sides of the CVT allow bed bugs to crawl into the unit. The clear view lens allows for easy pest identification. Remove and replace the trap. It's that easy.

Do I still need the bugman?

For severe bed bug infestations a pest control professional may be needed for initial control of bed bugs. The CVT is a great compliment to a pest control service. The CVT is not only a trap; it's a bed bug monitor. It lets you know if your bed bug problem has been resolved.

Where do I put the CVT?

The CVT can be put just about anywhere. Place the unit in between the mattress and box spring at the corners of the bed. Place traps against the wall or baseboards. Use them in the kitchen under the cupboards. The CVT is also an excellent trap for roaches.

How many CVT Bed Bug Traps do I need?

Use four CVT traps per bed in your house. Purchasing one case will cover three beds. Place one trap in each corner of the bed. You can also place the CVT under couches and cushions. Put a few along the base boards of the area that you suspect or know have had bed bugs. Use the CVT as a pest control monitor.

What do I do if I find bed bugs in the CVT?

Discard the unit and replace. Call a pest control professional. Use the CVT to monitor the results of your pest control service. Continues to monitor for 6 months.
